Sphinx SD Tools is an advanced CAD tool that provides a suitable environment for system dynamics simulations. It can be used for constructing models of business, scientific, environmental and social systems. This is Java-based utility so you need to deploy the working environment on your system before installing the tool. User interface and importing/exporting options The GUI looks clean and gives you the possibility to work with a model editor and simulator, and carry out experiments. On the downside, there's no support for a help manual so experimenting with the built-in features is your only chance to understand how the application works. You may save projects to a file on your computer so you can easily import data in the future, as well as save the model to a Java applet (JAR file format) and export

the model image to JPEG file format. The utility reveals a list with recent projects and lets you show or hide the grid in the editing environment and enable the antialiasing mode. Editing features Sphinx SD Tools allows you to import several preset objects in the editing panel, such as stock, convertor, flow, connector and stream. You may move objects to the desired location using the drag-and-drop support, expand or shrink items by dragging their corners, and zoom in or out of them. What's more, you can assign a name to each object, change the border color of each item, and fill in objects with gradient colors. The built-in formula editor gives you the freedom to work with several functions, while the table function graphical editor allows you plot graphs based on custom x and y coordinates. Simulation The simulation environment helps you generate execution charts and tables which can be copied to the clipboard for being transferred into other third-party applications, printed, or exported to PNG file format. There's also support for playback parameters that help you play, pause or stop the simulation. Performance Tests have shown that Sphinx SD Tools provides very good results. However, it eats up a lot of CPU and memory so the overall performance of your computer may be affected. An overall efficient system dynamics software app All in all, Sphinx SD Tools comes with a smart set of tools for helping you create system dynamic models, simulate them and view the results of the simulation. We have examined the response of brain vascular parameters after electrical stimulation of the rat orofacial region. The rat brain was perfusion fixed at intervals of 1, 10, 15, and 30 min following a single 10-s train of stimuli at an intensity of approximately 6 mA. This intensity was chosen to obtain the best signal to noise ratio on the vasoconstrictor response. Brain sections containing the cerebellum were processed and stained with an antibody against the endothelial cell surface marker, rat endothelial cell antigen (RECA-1). The area of the cerebral vasculature was calculated from the stained section, and the density of RECA-1 positive RECA-1 positive capillaries was measured within the contour of the vasculature. These data were analysed by univariate analysis of variance and one-way analysis of variance for repeated measures. The results indicate that there are changes in brain vascular dynamics following orofacial stimulation. These

changes occur in several respects. RECA-1 positive RECA-1 positive RECA-1 positive capillaries are significantly smaller in animals stimulated 1 min after stimulation than in control animals. This decrease in size appears to be a secondary effect, since the RECA-1 density is not significantly reduced. Similarly, the percentage of RECA-1 positive RECA-1 positive RECA-1 positive RECA-1 positive capillaries in stimulated animals appears to be greater at 10 and 15 min post-stimulation compared to the control values. Changes in arterio-venous transit time following stimulation were not observed. We therefore conclude that stimulation of the orofacial region is associated with rapid vascular changes in the brain.You can win an Apple Watch! Seedling Camp Seed Camp 2018 To celebrate the release of Apple's new hardware and software, we're hosting a week-long Seed Camp. The program is a camp for introverts, where you'll develop the skills to work on a self-sustaining, curated open source project for a minimum of 5 hours each day. The app is available for iOS and watchOS. The hardware is now available for pre-order, and we're offering a full refund to any who buy it between now and launch day. Apple provides the hardware, so you can focus entirely on writing great software. We'll provide the materials, including
