Novel experimental oral drug delivery system for treatment of ankylosing spondylitis: Effects on the bone. Spinal ankylosis is a clinical sign of severe and chronic low back pain and a major cause of permanent disability in patients with ankylosing spondylitis. The aim of the present study was to develop an organic drug delivery system, which can release an active drug at the site of action and can even enhance the therapeutic effect. The poly(DL-lactide-co-glycolide) (PLGA) microsphere formulation and the specially designed microsurgical implant were designed and evaluated for bone tissue engineering applications. The present study demonstrates that PLGA microspheres could maintain drug release for more than 3 months in vitro. High incorporation efficiency of drugs into PLGA microspheres was achieved by modifying the conditions
