

Now you're all set and can use your device on all your Windows PCs with a Windows 7, 8, 8.1, or Windows 10 operating system. If you want to make sure it's ready to go wherever you go, there are still a few more settings to update. Device Manager doesn't display devices or drivers that are associated with System Device Drivers or Platform Device Drivers. Some devices that are related to the Audio and Video device categories are related to the PnP category. In Windows 10, there is no longer an option to enable PnP devices in Device Manager. These device categories cannot be seen in Device Manager. By default, the AddReg directive assumes that the DeviceInterfaceGuids key contains an

---

array of strings, one GUID value per device interface. In Device Manager, each device interface has its own entry and is labeled Device ID: Device. In Windows 10, default drivers are unable to load and Windows will consider these devices ghost devices. To resolve this, you can define the DeviceInterfaceGuids key as a single string. For example, define the DeviceInterfaceGuids string as [ \Device\VID\_1F3A&PID\_0E8E]. AddReg: Add the registry entries specified in the.inf file. Only one of these sets is required to add your device. Use the AddReg directive to associate your device interface with the default driver functions for the USB architecture. Next, you associate each device port with the assigned default driver. Finally, register the windows function driver. While you are registering the function driver, be aware that you can pass optional device options that may be required by some device drivers. In Windows, optional device options are sent to the driver in the

---

DriverInstallParams structure. However, for Windows USB drivers, you should always pass the DriverInstallParams structure as NULL.

if you are having this issue, contact the manufacturer of the device to see if a new driver is available. you can remove the incorrect driver with the windows device manager. refer to the instructions below for removing an incorrect driver. to manually remove the incorrect device driver, press the win+r key to open the run box. in the run box type devmgmt.msc to open the device manager. the blue folder icon in the upper right corner of the device manager will give you the option to add or remove devices. if you see an incorrect driver listed, click the update driver button to update the driver. the incorrect driver is identified by the "yellow exclamation" symbol next to the driver. in this tutorial, we will be using the pine64, as there are a lot of

---

features of the pine that will help us with this solution. first, we will be using the sd card slot on the pine as a mass storage device over usb, and we will show how to access this sd card over usb from another computer without removing it from the pine a64. with u-boot fatload you can load an image to the sd card directly from a usb device. if you connect a sd card to the pine a64 via the sd card slot, you can load an image to the sd card directly from a usb device. however, there are some issues with using this approach: one of the approaches to overcome these issues is to load a linux kernel image to the sd card from a usb device. linux can be loaded to an sd card using the sdmmc driver. however, this driver expects the sd card to be formatted in a certain way. it expects the sd card to be formatted as a ufs file system. ufs is not supported by the sd card slot, so we will have to create the sd card as a fat file system. 5ec8ef588b
